

# CRYSTAL CREEK® BABY BUCK®

*A 16% Pellet Protein and Mineral Supplement For Gestating and Growing Deer*

Whitetail deer hunters across the nation are becoming keyed into the nutritional needs of their local deer populations with hopes of producing larger, healthier bucks on their hunting properties. Crystal Creek® is excited to announce the development of a new, wildlife supplement that provides hunters a unique strategy for producing larger bucks.

Recent University research has expanded on a novel approach to growing bigger bucks by focusing on the nutritional needs of the gestating doe. By providing does with a nutritionally balanced supplement, like Baby Buck®, during the late fall and winter months of gestation, we can improve the genetic capability of their offspring, producing the potential for larger, stronger bucks. This protein and mineral/vitamin supplement is available in an easy to feed pellet at a recommended feeding rate of ½ to 1 lb. per head per day and can be fed off the ground or through a feeding station. Typical feeder densities used are one feeder for every 100 acres of land being managed. Always check and comply with all state and federal regulations regarding the feeding of wildlife in your area. To learn more about the research and science behind Baby Buck®, call 1-888-376-6777 or visit us online at [www.crystalcreeknatural.com](http://www.crystalcreeknatural.com).
